PIPERAZINE, PIPERIDINE AND TETRAHYDROPYRIDINE DERIVATIVES OF INDOL-3-YLALKYL
AS 5-HT_{1D}-ALPHA AGONISTS

The present invention relates to a class of substituted
5 piperazine, piperidine and tetrahydropyridine derivatives which act on
5-hydroxytryptamine (5-HT) receptors, being selective agonists of so-called
"5-HT₁-like" receptors. They are therefore useful in the treatment of
clinical conditions for which a selective agonist of these receptors is
indicated.

10 It has been known for some time that 5-HT₁-like receptor
agonists which exhibit selective vasoconstrictor activity are of use in the
treatment of migraine (see, for example, A. Doenicke *et al.*, *The Lancet*,
1988, Vol. 1, 1309-11).

The human 5-HT₁-like or 5-HT_{1D} receptor has recently been
15 shown by molecular cloning techniques to exist in two distinct subtypes.
These subtypes have been termed 5-HT_{1D α} (or 5-HT_{1D-1}) and 5-HT_{1D β} (or
5-HT_{1D-2}), and their amino acid sequences are disclosed and claimed in
WO-A-91/17174.

The 5-HT_{1D α} receptor subtype in humans is believed to reside
20 on sensory terminals in the dura mater. Stimulation of the 5-HT_{1D α}
subtype inhibits the release of inflammatory neuropeptides which are
thought to contribute to the headache pain of migraine. The human
5-HT_{1D β} receptor subtype, meanwhile, is located predominantly on the
blood vessels and in the brain, and hence may play a part in mediating
25 constriction of cerebral and coronary arteries, as well as CNS effects.

Administration of the prototypical 5-HT_{1D} agonist
sumatriptan (GR43175) to humans is known to give rise at therapeutic
doses to certain adverse cardiovascular events (see, for example, F. Willett
et al., *Br. Med. J.*, 1992, 304, 1415; J.P. Ottervanger *et al.*, *The Lancet*,
30 1993, 341, 861-2; and D.N. Bateman, *The Lancet*, 1993, 341, 221-4). Since
sumatriptan barely discriminates between the human 5-HT_{1D α} and

- 2 -

5-HT_{1D β} receptor subtypes (cf. WO-A-91/17174, Table 1), and since it is the blood vessels with which the 5-HT_{1D β} subtype is most closely associated, it is believed that the cardiovascular side-effects observed with sumatriptan can be attributed to stimulation of the 5-HT_{1D β} receptor subtype. It is accordingly considered (cf. G.W. Rebeck *et al.*, *Proc. Natl. Acad. Sci. USA*, 1994, 91, 3666-9) that compounds which can interact selectively with the 5-HT_{1D α} receptor subtype, whilst having a less pronounced action at the 5-HT_{1D β} subtype, might be free from, or at any rate less prone to, the undesirable cardiovascular and other side-effects associated with non-subtype-selective 5-HT_{1D} receptor agonists, whilst at the same time maintaining a beneficial level of anti-migraine activity.

The compounds of the present invention, being selective 5-HT₁-like receptor agonists, are accordingly of benefit in the treatment of migraine and associated conditions, e.g. cluster headache, chronic paroxysmal hemicrania, headache associated with vascular disorders, tension headache and paediatric migraine. In particular, the compounds according to this invention are potent agonists of the human 5-HT_{1D α} receptor subtype. Moreover, the compounds in accordance with this invention have been found to possess at least a 10-fold selective affinity for the 5-HT_{1D α} receptor subtype relative to the 5-HT_{1D β} subtype, and they can therefore be expected to manifest fewer side-effects than those associated with non-subtype-selective 5-HT_{1D} receptor agonists.

Several distinct classes of substituted five-membered heteroaromatic compounds are described in published European patent applications 0438230, 0497512 and 0494774, and published International patent applications 93/18029, 94/02477 and 94/03446. The compounds described therein are stated to be agonists of 5-HT₁-like receptors, and accordingly to be of particular use in the treatment of migraine and associated conditions. None of these publications, however, discloses nor even suggests the piperazine, piperidine and tetrahydropyridine derivatives provided by the present invention.

- 3 -

In EP-A-0548813 is described a series of alkoxypyridin-4-yl and alkoxypyrimidin-4-yl derivatives of indol-3-ylalkylpiperazines which are alleged to provide treatment of vascular or vascular-related headaches, including migraine. There is, however, no disclosure nor any suggestion in EP-A-0548813 of replacing the alkoxypyridine or
5 alkoxypyrimidine substituent with an optionally substituted alkenyl, alkynyl, aryl-alkyl or heteroaryl-alkyl substituent; nor is there any suggestion therein that the range of substituents specified at the 5-position of the indole moiety might be successfully replaced by an
10 optionally substituted five-membered heteroaromatic ring.

Moreover, nowhere in the prior art available to date is there any disclosure of a subtype-selective 5-HT_{1D} receptor agonist having a 5-HT_{1D α} receptor binding affinity (IC₅₀) below 50 nM and at least a 10-fold selective affinity for the 5-HT_{1D α} receptor subtype relative to the 5-HT_{1D β}
15 subtype.

In one aspect, therefore, the present invention provides a subtype-selective 5-HT_{1D} receptor agonist having a 5-HT_{1D α} receptor binding affinity (IC₅₀) below 50 nM and at least a 10-fold selective affinity for the 5-HT_{1D α} receptor subtype relative to the 5-HT_{1D β} subtype. In a
20 preferred embodiment of this aspect, the present invention provides a subtype-selective 5-HT_{1D} receptor agonist having a 5-HT_{1D α} receptor binding affinity (IC₅₀) below 10 nM and at least a 50-fold selective affinity for the 5-HT_{1D α} subtype relative to the 5-HT_{1D β} subtype.

The invention also provides pharmaceutical compositions comprising one or more compounds of this invention in association with a pharmaceutically acceptable carrier. Preferably these compositions are in unit dosage forms such as tablets, pills, capsules, powders, granules, sterile parenteral solutions or suspensions, metered aerosol or liquid sprays, drops, ampoules, auto-injector devices or suppositories; for oral, parenteral, intranasal, sublingual or rectal administration, or for administration by inhalation or insufflation. For preparing solid compositions such as tablets, the principal active ingredient is mixed with a pharmaceutical carrier, e.g. conventional tableting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate, dicalcium phosphate or gums, and other pharmaceutical diluents, e.g. water, to form a solid preformulation composition containing a homogeneous mixture of a compound of the present invention, or a

- 19 -

pharmaceutically acceptable salt thereof. When referring to these preformulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This solid preformulation composition is then subdivided into unit dosage forms of the type described above containing from 0.1 to about 500 mg of the active ingredient of the present invention. Typical unit dosage forms contain from 1 to 100 mg, for example 1, 2, 5, 10, 25, 50 or 100 mg, of the active ingredient. The tablets or pills of the novel composition can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permits the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol and cellulose acetate.

The liquid forms in which the novel compositions of the present invention may be incorporated for administration orally or by injection include aqueous solutions, suitably flavoured syrups, aqueous or oil suspensions, and flavoured emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil, as well as elixirs and similar pharmaceutical vehicles. Suitable dispersing or suspending agents for aqueous suspensions include synthetic and natural gums such as tragacanth, acacia, alginate, dextran, sodium carboxymethylcellulose, methylcellulose, polyvinyl-pyrrolidone or gelatin.

In the treatment of migraine, a suitable dosage level is about 0.01 to 250 mg/kg per day, preferably about 0.05 to 100 mg/kg per day,

- 20 -

and especially about 0.05 to 5 mg/kg per day. The compounds may be administered on a regimen of 1 to 4 times per day.

The compounds according to the invention wherein -F-G- represents -CH₂-N- may be prepared by a process which comprises

- 5 attachment of the R¹ moiety to a compound of formula III:

- 10 wherein Z, E, Q, T, U and V are as defined above; by conventional means including N-alkylation.

- Attachment of the R¹ moiety to the compounds of formula III may conveniently be effected by standard alkylation techniques. One example thereof comprises treatment with an alkenyl halide such as 4-bromobut-1-ene, 4-bromo-2-methylbut-2-ene or allyl bromide, an alkynyl
- 15 halide such as propargyl bromide, or an aryl(C₁₋₆)alkyl or heteroaryl(C₁₋₆)alkyl halide such as benzyl iodide, typically under basic conditions, e.g. sodium hydride or potassium carbonate in N,N-dimethylformamide, or triethylamine in acetonitrile. Another example comprises treatment of the compound of formula III with an aryl(C₁₋₆)alkyl
- 20 or heteroaryl(C₁₋₆)alkyl mesylate such as 2-(4-cyanophenyl)ethyl methanesulphonate, typically in the presence of sodium carbonate and sodium iodide, in a suitable solvent such as 1,2-dimethoxyethane.

- Alternatively, the R¹ moiety may conveniently be attached by reductive alkylation, which may be accomplished in a single step, or as a
- 25 two-step procedure. The single-step approach suitably comprises treating the required compound of formula III as defined above with the appropriate aldehyde, e.g. benzaldehyde, furfuraldehyde or thiophene

- 21 -

carboxaldehyde, in the presence of a reducing agent such as sodium cyanoborohydride. In a typical two-step procedure, for the preparation of a compound of formula I wherein R^1 corresponds to a group of formula $-CH_2R^{11}$, a carboxylic acid derivative of formula $R^{11}-CO_2H$ is condensed
 5 with the required compound of formula III, suitably in the presence of 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride and 1-hydroxybenzotriazole hydrate, to afford a compound corresponding to formula I wherein R^1 represents $-COR^{11}$; the carbonyl group thereof can then be reduced, for example by treatment with diisobutylaluminium
 10 hydride, and the required compound of formula I thereby obtained.

The compounds of formula III above wherein T represents CH, U represents $C-R^2$ and V represents $N-R^3$, corresponding to the indole derivatives of formula ID as defined above wherein T represents CH, -F-G- represents $-CH_2-N-$ and R^1 is hydrogen, may be prepared by a
 15 process which comprises reacting a compound of formula IV:

wherein Z and E are as defined above; with a compound of formula V, or a
 20 carbonyl-protected form thereof:

wherein R^2 and Q are as defined above, and R^p represents an amino-
 25 protecting group; followed, where required, by N-alkylation by standard

- 22 -

methods to introduce the moiety R^3 ; with subsequent removal of the amino-protecting group R^p .

The reaction between compounds IV and V, which is an example of the well-known Fischer indole synthesis, is suitably carried out by heating the reagents together under mildly acidic conditions, e.g. 4% sulphuric acid at reflux.

Suitable carbonyl-protected forms of the compounds of formula V include the dimethyl acetal or ketal derivatives.

The protecting group R^p in the compounds of formula V is suitably a carbamoyl moiety such as t-butoxycarbonyl (BOC), which can conveniently be removed as necessary by treatment under mildly acidic conditions. Indeed, the acidic conditions of the Fischer indole synthesis reaction will generally suffice to remove the BOC group.

The Fischer reaction between compounds IV and V may be carried out in a single step, or may proceed via an initial non-cyclising step at a lower temperature to give an intermediate of formula VI:

(VI)

wherein Z, E, Q, R^2 and R^p are as defined above; followed by cyclisation using a suitable reagent, e.g. a polyphosphate ester.

The intermediates of formula V, or carbonyl-protected forms thereof, may be prepared by reacting a compound of formula VII, or a carbonyl-protected form thereof, with a compound of formula VIII:

25

- 23 -

(VII)

(VIII)

wherein Q, R² and R^p are as defined above, and L¹ represents a suitable leaving group.

5 The leaving group L¹ is suitably a halogen atom, e.g. chlorine or bromine.

Where L¹ represents a halogen atom, the reaction between compounds VII and VIII is conveniently effected by stirring the reactants under basic conditions in a suitable solvent, for example potassium carbonate in N,N-dimethylformamide, or triethylamine in
10 tetrahydrofuran or acetonitrile.

The compounds according to the invention wherein T represents CH, U represents C-R² and V represents N-R³ - i.e. the indole derivatives of formula ID as defined above - may alternatively be prepared
15 by a process which comprises reacting a compound of formula IV as defined above with a compound of formula IX, or a carbonyl-protected form thereof:

(IX)

20

wherein Q, F, G, R¹ and R² are as defined above; under conditions analogous to those described above for the reaction between compounds IV and V; followed, where required, by N-alkylation by standard methods to introduce the moiety R³.

25

As for the compounds of formula V, suitable carbonyl-protected forms of the compounds of formula IX include the dimethyl

acetal or ketal derivatives. Where the alkylene chain Q is substituted by a hydroxy group, this group may condense with the carbonyl moiety in compounds V and IX, whereby the carbonyl moiety is protected in the form of a cyclic hemiacetal.

5 As with that between compounds IV and V, the Fischer reaction between compounds IV and IX may be carried out in a single step, or may proceed via an initial non-cyclising step at a lower temperature to give an intermediate of formula X:

(X)

wherein Z, E, Q, F, G, R¹ and R² are as defined above; followed by cyclisation using a suitable reagent, e.g. a polyphosphate ester.

The intermediates of formula IX, or carbonyl-protected forms thereof, may be prepared by reacting a compound of formula VII as defined above, or a carbonyl-protected form thereof, with a compound of formula XI:

(XI)

20

wherein F, G and R¹ are as defined above; under conditions analogous to those described above for the reaction between compounds VII and VIII.

In an alternative procedure, the compounds of formula III above may be prepared by a process which comprises reacting a compound of formula VIII as defined above with a compound of formula XII:

- 25 -

(XII)

wherein Z, E, Q, T, U and V are as defined above, and L² represents a
 5 suitable leaving group; followed by removal of the amino-protecting group
 R^p.

Similarly, the compounds of formula I as defined above may
 be prepared by a process which comprises reacting a compound of formula
 XI as defined above with a compound of formula XII as defined above.

10 The leaving group L² is suitably an alkylsulphonyloxy or
 arylsulphonyloxy group, e.g. methanesulphonyloxy (mesyloxy) or
 p-toluenesulphonyloxy (tosyloxy).

Where L² represents an alkylsulphonyloxy or
 arylsulphonyloxy group, the reaction between compound XII and
 15 compound VIII or XI is conveniently carried out in a suitable solvent such
 as 1,2-dimethoxyethane or isopropyl alcohol, typically in the presence of a
 base such as sodium carbonate or potassium carbonate, optionally with
 the addition of a catalytic amount of sodium iodide.

In a representative embodiment, the compounds of formula
 20 XII wherein T and U both represent CH, V represents NH, Q represents a
 propylene chain and L² represents a mesyloxy or tosyloxy group may be
 prepared by reacting 3,4-dihydro-2H-pyran with a compound of formula
 IV as defined above or a salt thereof, under a variant of the Fischer
 reaction conditions as described above for the reaction between
 25 compounds IV and V; followed by mesylation or tosylation of the 3-
 hydroxypropyl-indole derivative thereby obtained, typically by treatment
 with mesyl chloride or tosyl chloride under standard conditions.

- 26 -

The Fischer reaction with 3,4-dihydro-2H-pyran is suitably brought about by heating the hydrazine derivative IV or an acid addition salt thereof, typically the hydrochloride salt, in an inert solvent such as dioxan, advantageously in the presence of a mineral acid such as hydrochloric acid or a Lewis acid such as zinc chloride, at the reflux temperature of the solvent.

In a further procedure, the compounds of formula III above wherein T represents CH, U represents nitrogen and V represents N-R³, corresponding to the indazole derivatives of formula IB as defined above wherein -F-G- represents -CH₂-N- and R¹ is hydrogen, may be prepared by a process which comprises cyclising a compound of formula XIII:

(XIII)

wherein Z, E, Q and R^p are as defined above, and D¹ represents a readily displaceable group; followed, where required, by N-alkylation by standard methods to introduce the moiety R³; with subsequent removal of the amino-protecting group R^p.

Similarly, the compounds of formula I wherein T represents CH, U represents nitrogen and V represents N-R³ - i.e. the indazole derivatives of formula IB as defined above - may be prepared by a process which comprises cyclising a compound of formula XIV:

- 27 -

(XIV)

in which Z, E, Q, F, G, R¹ and D¹ are as defined above.

The cyclisation of compounds XIII and XIV is conveniently
 5 achieved in a suitable organic solvent at an elevated temperature, for
 example in a mixture of m-xylene and 2,6-lutidine at a temperature in the
 region of 140°C.

The readily displaceable group D¹ in the compounds of
 formula XIII and XIV suitably represents a C₁₋₄ alkanoyloxy group,
 10 preferably acetoxy. Where D¹ represents acetoxy, the desired compound of
 formula XIII or XIV may be conveniently prepared by treating a carbonyl
 compound of formula XV:

(XV)

15

wherein Z, E, Q, F and G are as defined above, and R^x corresponds to the
 group R¹ as defined above, or R^x represents an amino-protecting group as
 defined for R^p when -F-G- represents -CH₂-N-; or a protected derivative
 thereof, preferably the N-formyl protected derivative; with hydroxylamine
 20 hydrochloride, advantageously in pyridine at the reflux temperature of

- 28 -

the solvent; followed by acetylation with acetic anhydride, advantageously in the presence of a catalytic quantity of 4-dimethylaminopyridine, in dichloromethane at room temperature.

The N-formyl protected derivatives of the intermediates of formula XV may conveniently be prepared by ozonolysis of the
5 corresponding indole derivative of formula XVI:

10 wherein Z, E, Q, F, G and R^x are as defined above; followed by a reductive work-up, advantageously using dimethylsulphide.

The indole derivatives of formula XVI may be prepared by methods analogous to those described in the accompanying Examples, or by procedures well known from the art.

15 In a still further procedure, the compounds of formula III above wherein T represents CH, U represents C-R² and V represents oxygen or sulphur, corresponding to the benzofuran or benzthiophene derivatives of formula IA wherein V is oxygen or sulphur respectively, -F-G- represents -CH₂-N- and R¹ is hydrogen, may be prepared by a
20 process which comprises cyclising a compound of formula XVII:

- 29 -

wherein Z, E, Q, R² and R^p are as defined above, and V¹ represents oxygen or sulphur; followed by removal of the amino-protecting group R^p.

Similarly, the compounds of formula I wherein T represents CH, U represents C-R² and V represents oxygen or sulphur - i.e. the
 5 benzofuran or benzthiophene derivatives of formula IA above - may be prepared by a process which comprises cyclising a compound of formula XVIII:

10

wherein Z, E, Q, F, G, R¹, R² and V¹ are as defined above.

The cyclisation of compounds XVII and XVIII is conveniently effected by using polyphosphoric acid or a polyphosphate ester, advantageously at an elevated temperature.

15

The compounds of formula XVII and XVIII may be prepared by reacting a compound of formula XIX with a compound of formula XX:

20

wherein Z, E, Q, F, G, R², V¹ and R^x are as defined above, and Hal represents a halogen atom.

The reaction is conveniently effected in the presence of a base such as sodium hydroxide.

- 30 -

The hydroxy and mercapto derivatives of formula XIX may be prepared by a variety of methods which will be readily apparent to those skilled in the art. One such method is described in EP-A-0497512.

In a yet further procedure, the compounds of formula III
 5 above may be prepared by a process which comprises reducing a compound of formula XXI:

10 wherein Z, E, T, U, V and R^p are as defined above, and -Q²-CH₂- corresponds to the moiety Q as defined above; with subsequent removal of the amino-protecting group R^p.

The reaction is suitably carried out by treating the compound of formula XXI with a reducing agent such as lithium aluminium hydride
 15 in an appropriate solvent, e.g. diethyl ether or tetrahydrofuran, or mixtures thereof.

Similarly, the compounds according to the invention may be prepared by a process which comprises reducing a compound of formula XXII:

20

wherein Z, E, T, U, V, F, G, R¹ and Q² are as defined above.

- 31 -

As with compound XXI, the reduction is conveniently effected by treating compound XXII with a reducing agent such as lithium aluminium hydride in an appropriate solvent, e.g. diethyl ether or tetrahydrofuran, or mixtures thereof.

- 5 The compounds of formulae XXI and XXII above may suitably be prepared by reacting a compound of formula XXIII with the appropriate compound of formula XXIV:

(XXIII)

(XXIV)

10

wherein Z, E, T, U, V, F, G, R^x and Q² are as defined above, and J represents a reactive carboxylate moiety.

- Suitable values for the reactive carboxylate moiety J include esters, for example C₁₋₄ alkyl esters; acid anhydrides, for example mixed
 15 anhydrides with C₁₋₄ alkanolic acids; acid halides, for example acid chlorides; and acylimidazoles.

- By way of example, the intermediates of formula XXIII above wherein J is an acid chloride moiety may be prepared by treating the corresponding carboxylic acid derivative with thionyl chloride in toluene.
 20 Similarly, the intermediates of formula XXIII wherein J is an acylimidazole moiety may be prepared by treating the corresponding carboxylic acid derivative with 1,1'-carbonyldiimidazole. Alternatively, the reactive carboxylate moiety J may be obtained by treating the corresponding compound wherein J is carboxy with
 25 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride and 1-hydroxybenzotriazole hydrate, optionally in the presence of triethylamine;

- 32 -

the resulting activated carboxylate intermediate may then suitably be reacted *in situ* with the required compound of formula XXIV.

The hydrazine derivatives of formula IV above may be prepared by methods analogous to those described in EP-A-0438230 and
5 EP-A-0497512.

Where they are not commercially available, the starting materials of formula VII, VIII, XI, XX, XXIII and XXIV may be prepared by methods analogous to those described in the accompanying Examples, or by standard procedures well known from the art.

10 It will be understood that any compound of formula I initially obtained from any of the above processes may, where appropriate, subsequently be elaborated into a further compound of formula I by techniques known from the art. For example, a compound of formula I wherein -F-G- represents -CH=C- initially obtained may be readily
15 converted into the corresponding compound wherein -F-G- represents -CH₂-CH- by conventional catalytic hydrogenation procedures. In addition, a compound of formula I wherein R¹ is benzyl initially obtained may be converted by catalytic hydrogenation to the corresponding compound of formula III, which in turn may be converted into a further
20 compound of formula I using standard N-alkylation techniques as described above. Furthermore, a compound of formula I initially obtained wherein the R¹ moiety is substituted by nitro or cyano may be converted by catalytic hydrogenation to the corresponding amino- or aminomethyl-substituted compound respectively. Additionally, a compound of formula I
25 wherein the R¹ moiety is substituted by hydroxy, possibly obtained by lithium aluminium hydride reduction of a precursor alkoxycarbonyl derivative, may be mesylated under standard conditions, and the mesyl group subsequently displaced by an amino moiety by treatment with the desired amine in a sealed tube at an elevated temperature. The amine
30 derivative resulting from any of these procedures may then, for example, be N-acylated using the appropriate acyl halide, e.g. acetyl chloride; or

- 33 -

aminocarbonylated, using potassium isocyanate, to the corresponding urea derivative; or converted to a 1,2,4-triazol-4-yl derivative using N,N-dimethylformamide azine; or reductively alkylated by treatment with the appropriate aldehyde or ketone in the presence of sodium

5 cyanoborohydride. If desired, the amine derivative may also be carbamoylated by treatment with the requisite alkyl chloroformate. A compound of formula I initially obtained wherein the R¹ moiety is substituted by cyano may be converted, by treatment with sodium azide, to the corresponding tetrazole derivative, which in turn may be alkylated

10 on the tetrazole ring by treatment with an alkyl halide under standard conditions. By way of additional illustration, a compound of formula I initially obtained wherein the R¹ moiety is substituted by an alkoxy carbonyl moiety may be saponified, by treatment with an alkali metal hydroxide, to the corresponding carboxy-substituted compound,

15 which in turn may be converted to an amide derivative by treatment with the appropriate amine, advantageously in the presence of 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride and 1-hydroxybenzotriazole. Moreover, a compound of formula I wherein R³ is hydrogen initially obtained may be converted into a compound of formula

20 I wherein R³ represents C₁₋₆ alkyl by standard alkylation techniques, for example by treatment with an alkyl iodide, e.g. methyl iodide, typically under basic conditions, e.g. sodium hydride in dimethylformamide, or triethylamine in acetonitrile.

Where the above-described processes for the preparation of

25 the compounds according to the invention give rise to mixtures of stereoisomers, these isomers may be separated by conventional techniques such as preparative chromatography. The novel compounds may be prepared in racemic form, or individual enantiomers may be prepared either by enantiospecific synthesis or by resolution. The novel compounds

30 may, for example, be resolved into their component enantiomers by standard techniques such as preparative HPLC, or the formation of

- 34 -

diastereomeric pairs by salt formation with an optically active acid, such as (-)-di-p-toluoyl-d-tartaric acid and/or (+)-di-p-toluoyl-l-tartaric acid, followed by fractional crystallization and regeneration of the free base. The novel compounds may also be resolved by formation of diastereomeric esters or amides, followed by chromatographic separation and removal of the chiral auxiliary.

During any of the above synthetic sequences it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This may be achieved by means of conventional protecting groups, such as those described in *Protective Groups in Organic Chemistry*, ed. J.F.W. McOmie, Plenum Press, 1973; and T.W. Greene & P.G.M. Wuts, *Protective Groups in Organic Synthesis*, John Wiley & Sons, 1991. The protecting groups may be removed at a convenient subsequent stage using methods known from the art.

The following Examples illustrate the preparation of compounds according to the invention.

The compounds in accordance with the present invention potently and selectively bind to the 5-HT_{1D α} receptor subtype, inhibit forskolin-stimulated adenylyl cyclase activity, and stimulate [³⁵S]-GTP γ S binding to membranes from clonal cell lines expressing human cloned receptors.

5-HT_{1D α} /5-HT_{1D β} Radioligand Binding

Chinese hamster ovary (CHO) clonal cell lines expressing the human 5-HT_{1D α} and 5-HT_{1D β} receptors were harvested in PBS and homogenised in ice cold 50 mM Tris-HCl (pH 7.7 at room temperature) with a Kinematica polytron and centrifuged at 48,000g at 4°C for 11 min. The pellet was then resuspended in 50 mM Tris-HCl followed by a 10 min incubation at 37°C. Finally the tissue was recentrifuged at 48,000g, 4°C for 11 min and the pellet resuspended, in assay buffer (composition in

- 35 -

mM: Tris-HCl 50, pargyline 0.01, CaCl₂ 4; ascorbate 0.1%; pH 7.7 at room temperature) to give the required volume immediately prior to use (0.2 mg protein/ml). Incubations were carried out for 30 min at 37°C in the presence of 0.02-150 nM [³H]-5-HT for saturation studies or 2-5 nM [³H]-5-HT for displacement studies. The final assay volume was 1 ml. 5-HT (10 μM) was used to define non-specific binding. The reaction was initiated by the addition of membrane and was terminated by rapid filtration through Whatman GF/B filters (presoaked in 0.3% PEI/ 0.5% Triton X) followed by 2 x 4 ml washings with 50 mM Tris-HCl. The radioactive filters were then counted on a LKB beta or a Wallac beta plate counter. Binding parameters were determined by non-linear, least squares regression analysis using an iterative curve fitting routine, from which IC₅₀ (the molar concentration of compound necessary to inhibit binding by 50%) values could be calculated for each test compound. The IC₅₀ values for binding to the 5-HT_{1Dα} receptor subtype obtained for the compounds of the accompanying Examples were below 50 nM in each case. Furthermore, the compounds of the accompanying Examples were all found to possess a selective affinity for the 5-HT_{1Dα} receptor subtype of at least 10-fold relative to the 5-HT_{1Dβ} subtype.

5-HT_{1Dα}/5-HT_{1Dβ} Adenylyl Cyclase Assay

Studies were performed essentially as described in J. Pharmacol. Exp. Ther., 1986, 238, 248. CHO clonal cell lines expressing the human cloned 5-HT_{1Dα} and 5-HT_{1Dβ} receptors were harvested in PBS and homogenised, using a motor driven teflon/glass homogeniser, in ice cold Tris HCl-EGTA buffer (composition in mM: Tris HCl 10, EGTA 1, pH 8.0 at room temperature) and incubated on ice for 30-60 min. The tissue was then centrifuged at 20,000g for 20 min at 4°C, the supernatant discarded and the pellet resuspended in Tris HCl-EDTA buffer

30

- 36 -

(composition in mM: Tris HCl 50, EDTA 5, pH 7.6 at room temperature) just prior to assay. The adenylyl cyclase activity was determined by measuring the conversion of α -[^{33}P]-ATP to [^{33}P]-cyclic AMP. A 10 μl aliquot of the membrane suspension was incubated, for 10-15 min, in a

5 final volume of 50 μl , at 30°C, with or without forskolin (10 μM), in the presence or absence of test compound. The incubation buffer consisted of 50 mM Tris HCl (pH 7.6 at room temperature), 100 mM NaCl, 30 μM GTP, 50 μM cyclic AMP, 1 mM dithiothreitol, 1 mM ATP, 5 mM MgCl_2 , 1 mM EGTA, 1 mM 3-isobutyl-1-methylxanthine, 3.5 mM creatinine

10 phosphate, 0.2 mg/ml creatine phosphokinase, 0.5-1 μCi α -[^{33}P]-ATP and 1 nCi [^3H]-cyclic AMP. The incubation was initiated by the addition of membrane, following a 5 min preincubation at 30°C, and was terminated by the addition of 100 μl SDS (composition in mM: sodium lauryl sulphate 2%, ATP 45, cyclic AMP 1.3, pH 7.5 at room temperature). The ATP and

15 cyclic AMP were separated on a double column chromatography system (*Anal. Biochem.*, 1974, 58, 541). Functional parameters were determined using a least squares curve fitting programme ALLFIT (*Am. J. Physiol.*, 1978, 235, E97) from which E_{max} (maximal effect) and EC_{50} (the molar concentration of compound necessary to inhibit the maximal effect by

20 50%) values were obtained for each test compound. Of those compounds which were tested in this assay, the EC_{50} values for the 5-HT $_{1D\alpha}$ receptor obtained for the compounds of the accompanying Examples were below 500 nM in each case. Moreover, the compounds of the accompanying

Examples which were tested were all found to possess at least a 10-fold

25 selectivity for the 5-HT $_{1D\alpha}$ receptor subtype relative to the 5-HT $_{1D\beta}$ subtype.

cloned 5-HT_{1D α} and 5-HT_{1D β} receptors were harvested in PBS and homogenised using a Kinematica polytron in ice cold 20 mM HEPES containing 10 mM EDTA, pH 7.4 at room temperature. The membranes were then centrifuged at 40,000g, 4°C for 15 min. The pellet was then
5 resuspended in ice cold 20 mM HEPES containing 0.1 mM EDTA, pH 7.4 at room temperature and recentrifuged at 40,000g, 4°C for 15-25 minutes. The membranes were then resuspended in assay buffer (composition in mM: HEPES 20, NaCl 100, MgCl₂ 10, pargyline 0.01; ascorbate 0.1%; pH 7.4 at room temperature) at a concentration of 40 µg protein/ml for the
10 5-HT_{1D α} receptor transfected cells and 40-50 µg protein/ml for the 5-HT_{1D β} receptor transfected cells. The membrane suspension was then incubated, in a volume of 1 ml, with GDP (100 µM for 5-HT_{1D α} receptor transfected cells, 30 µM for the 5-HT_{1D β} receptor transfected cells) and test compound at 30°C for 20 min and then transferred to ice for a further 15 min.
15 [³⁵S]-GTP γ S was then added at a final concentration of 100 pM and the samples incubated for 30 min at 30°C. The reaction was initiated by the addition of membrane and was terminated by rapid filtration through Whatman GF/B filters and washed with 5 ml water. The radioactive filters were then counted on a LKB beta counter. Functional parameters

Of those compounds which were tested in this assay, the EC₅₀ values for the
25 5-HT_{1D α} receptor obtained for the compounds of the accompanying Examples were below 500 nM in each case. Moreover, the compounds of the accompanying Examples which were tested were all found to possess at least a 10-fold selectivity for the 5-HT_{1D α} receptor subtype relative to the 5-HT_{1D β} subtype.

INTERNATIONAL SEARCH REPORT

national application No.

PCT/GB95/01129

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
Although claim 16 is directed to a method of treatment of (diagnostic method practised on) the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
Claims 1 and 2 are not defined by a chemical structure.
Claims not searched: 1 and 2
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
